Energy optimization

Energy efficient drives can be realized by servo pump drive. The drives will be driven down to **minimum energy use** during the breaks. As far as drawing cushions are equipped with automotive the displacement energy can be charged back to the net.

If energy efficiency projects are economic concerning the investment depends essentially on the planned case of application (load profile). Just give us your case of application in! We are going to prepare a **reliable investigation concerning the possibilities of energy savings**.

A lot of other competitors are providing overall percentage values for the energy savings. We decline this kind of procedure as we are calculating with **real values for your special case of application**.

Only this way the topic energy savings can be completed reliable and physical proved in mutual agreement and interest.
